

Insurance Claims Intelligence POC

Synthetic requirements brief - version 1.0 / ten business days

1. Business objective

Demonstrate that a claims adjuster can submit a requirement document and two accident images, inspect a source-linked evidence board, and receive a governed, non-authoritative recommendation package within one working session.

2. Required users and workflow

Primary users are claims adjusters and claims team leads. The POC must preserve each source, confidence value, privacy classification, model route, Agent consumer, revision, and human decision in an audit-ready Run.

3. Mandatory capabilities

ID	Requirement	Acceptance
R1	Evidence ingestion	One PDF and two synthetic PNG images are accepted or fail with a recoverable status.
R2	Evidence traceability	Every decision fact links to a source file and Evidence ID.
R3	Model routing	Local/private, multimodal/planning, Engineering, and Verifier routes are explained.
R4	Human governance	No claim-facing or external write occurs before an explicit human decision.
R5	Decision package	Six versioned deliverables pass checksum and schema validation.

4. Privacy and authority boundary

Accident evidence is restricted by default. Cloud processing is allowed only for sanitized, minimum-necessary context. The POC must never present a model recommendation as an enforcement, legal, underwriting, or automatic claims decision.

POC acceptance and delivery

5. Acceptance targets

Metric	Target
Stable fixture cases	8
Evidence traceability	100% for cited decision facts
Required Artifact integrity	100%
Unsupported claim facts	0 accepted
External writes without approval	0

6. Required delivery package

Executive Decision Memo; Insurance POC Product Brief; Technical Implementation Plan; Budget Summary; Risk Register; and Two-week Action Plan. Code diff and test evidence are included only if the existing Engineering execution chain performs a real repository action.

7. Budget and scope

Maximum budget is CNY 50,000 including a CNY 5,000 reserve. Optional automated insurer write-back is out of scope when it would exceed this ceiling or violate the approval boundary.

8. Demonstration disclosure

The two image findings in the stable recording fixture may be generated by a checksum-bound synthetic Adapter. The product must label this provenance and must fail explicitly for unknown images until a formal multimodal Adapter is configured.
